Subject: Enable User Identification on the firewall

We need to be able to properly identify users so we can selectively enforce policies on the firewall based on AD groups or individual users. I need you to implement the built in Palo Alto User-ID Agent feature so we can pull user and group information from the Active Directory servers. I've provided a link to the Palo Alto Documentation on how to configure the built in User-ID agent, https://www.paloaltonetworks.com/documentation/60/pan-os/pan-os/user-id/configure-user-mapping-using-the-pan-os-integrated-user-id-agent

Once you've completed this document your configuration on the firewall and show that the firewall is actively identifying users. Run the following CLI command on the firewall "show user ip-user-mapping all" to show that users are now being identified, include the output of this command with your submission.

Thank you.

Your boss
